Road Trip Planner

Our application will allow the user to plan a road trip with starting and end points. It will provide them with a suggested route and attractions/hotspots along the way.

Each hotspot could potentially have reviews, photos, and suggestions submitted by previous users and site admins.

A login page would allow users with accounts to work on creating a road trip and save their progress in a database.

An API googlemaps add-in will allow users of the application to view their trip on a map.

An administrator side of the site would allow admins to add places, but not users. However, users could add photos and information to the hotspots.

The application would be targeted at the general driving population with an emphasis on younger crowds. For example, a nightclub in Las Vegas might be included but not a museum. Flights would not be included; it is purely a driving application.

Features will potentially still be added or deleted as we learn more in class and decide what might be too difficult for us.
